

1. A network, comprising:

5 a master subnet manager, wherein the master subnet manager is coupled to provide network topology data;

a requested traffic pattern for a packet; and

10 a connection controller, wherein the connection controller is coupled to receive the requested traffic pattern and the network topology data, compute an actual traffic pattern for the packet and communicate the actual traffic pattern to a source corresponding to the packet such that the network operates as a strictly non-interfering network.

2. The network of claim 1, wherein the connection controller comprises a packing algorithm, wherein the packing algorithm utilizes the requested traffic pattern and the network topology data to compute the actual traffic pattern.

15.

3. The network of claim 1, wherein the network further comprises a plurality of InfiniBand switches, and wherein the connection controller:

calculates a plurality of routing trees for the plurality of InfiniBand switches;

20 calculates a plurality of DLIDs and a set of forwarding instructions for each of the plurality of InfiniBand switches, wherein each of the plurality of DLIDs corresponds to one of the plurality of routing trees and one of a plurality of destinations in the network; and

populates a forwarding table of each of the plurality of InfiniBand switches in the network with the plurality of DLIDs and the set of forwarding instructions.

25

4. The network of claim 1, wherein computing an actual traffic pattern comprises executing a rearrangement algorithm and assigning one of a plurality of DLIDs to the packet such that the network operates as a strictly non-interfering network.

30 5. The network of claim 4, wherein the network further comprises a plurality of InfiniBand switches, wherein the packet follows a path through at least a portion of the plurality of InfiniBand switches in the network, and wherein each of the portion of the plurality of InfiniBand switches forwards the packet according to the one of the plurality

of DLIDs assigned to the packet such that the network operates as a strictly non-interfering network.

6. The network of claim 5, wherein each of the portion of the plurality of
5 InfiniBand switches looks up the one of the plurality of DLIDs assigned to the packet in a forwarding table.

7. The network of claim 5, wherein each of the portion of the plurality of
10 InfiniBand switches forwards the packet in accordance with the one of the plurality of DLIDs assigned to the packet as found in a forwarding table.

8. The network of claim 1, wherein the network is a Clos network.

9. A network comprising a computer-readable medium containing computer
15 instructions for instructing a processor to perform a method of populating a forwarding table, the instructions comprising:
calculating a plurality of routing trees for a plurality of InfiniBand switches;
calculating a plurality of DLIDs and a set of forwarding instructions for each of the
plurality of InfiniBand switches, wherein each of the plurality of DLIDs corresponds to
20 one of the plurality of routing trees and one of a plurality of end nodes; and
populating the forwarding table of each of the plurality of InfiniBand switches in the network with the plurality of DLIDs and the set of forwarding instructions.

10. The network of claim 9, wherein the network is a Clos network.
25

11. The network of claim 9, wherein each of the plurality of end nodes comprises a destination, and wherein the destination is identified by a BaseLID.

12. The network of claim 9, wherein calculating the plurality of routing trees
30 comprises for each spine node in the network, calculating a shortest path from the spine node to each of the plurality of end nodes.

13. The network of claim 9, wherein each of the plurality of routing trees comprises at least a portion of the plurality of InfiniBand switches and corresponding plurality of links that form a shortest path from one of the plurality of end nodes to a spine node of the network.

5

14. A network comprising a computer-readable medium containing computer instructions for instructing a processor to perform a method of forwarding a packet, wherein the packet is created at a source and is addressed to a destination within the network, the instructions comprising:

10 executing a rearrangement algorithm for the network;
 assigning one of a plurality of DLIDs to the packet; and
 the packet following a path through at least a portion of a plurality of InfiniBand switches from the source to the destination, wherein each of the portion of the plurality of InfiniBand switches forward the packet according to the one of the plurality of DLIDs
15 assigned to the packet.

15. The network of claim 14, wherein the network operates as a strictly non-interfering network.

20 16. The network of claim 14, wherein the network is a Clos network.

17. The network of claim 14, wherein the packet following the path comprises looking up the one of the plurality of DLIDs assigned to the packet in a forwarding table at each of the portion of the plurality of InfiniBand switches along the path from the source
25 to the destination.

18. The network of claim 14, wherein the packet following the path comprises each of the portion of the plurality of InfiniBand switches forwarding the packet in accordance with the one of the plurality of DLIDs assigned to the packet as found in a
30 forwarding table at each the portion of the plurality of InfiniBand switches.
